## 1. Introduction of Module

### 1.1 Introduction

GM65-S Bar code reader module is a high performance scanner, can read 1D bar code easily and read 2D bar code with high speed. It also wins high scan speed for linear code, even for bar code on paper or screen.

GM65-S bar code reader module is an advanced bar code decoding algorithm which developed on image recognition algorithm, can easily and accurately read bar code, simplify secondary development.

GM65-S works stable in dark and large temperature range.

### 1.2 Technical Specification

Default scan mode		Continuous scan	
Read code time for once		3s	Parameter: 0.1-25.5s; step-size: 0.1s; 0 means no time limited
Reading interval		1S	Parameter: 0.1-25.5s; step-size: 0.1s; 0 means no time limited
Output		GBK	GBK、UNICODE、BIG5
Interface		USB	USB 、UART、USB VCom
Interface ( TTL-232)	Serial Baud Rate	9600	adjustable, details at 2.1
	Verification	N	
	Data bit	8	
	Stop bit	1	
	CTSRTS	No	
serial mode	Read code time for once	5s	Parameter: 0.1-25.5s; step-size: 0.1s; 0 means no time limited

Electrical specification:

1	Operating Voltage	DC 3.3V
2	Standby Current	30mA
3	Operating Current	160mA
4	Sleep Current	3mA

Running characteristic

1	Light	White light
2	Capture light	Red
3	Scan Angle	Roll:0-360° , Pitch:±65° , Yaw:±60°
4	Resolution	648x 488
5	Scanning angle	35° (Inclination) , 28° (Elevation)

Physics specification:

1	Weight	7g
2	Size	21.4*13.5*11.8mm

## 1.3 Dimension(mm)

## Scan Area (testing in office (250 lux))

Type of Bar Code	Density	Min. distance	Max. distance
Code 39	0.125 mm (5 mils)	4.0 cm	9.0 cm
	0.375 mm (15 mils)	4.0 cm	25.0cm
UPC/EAN	0.375 mm (15 mils)	4.0 cm	25.0cm
Code93	0.254 mm (10 mils)	4.0 cm	21.0cm

## 1.4 Data Interface

PIN	Input/Output	Definition	Remark
PIN 1	—	NC	/
PIN 2	Power	VCC	DC3.3V
PIN 3	GND	GND	
PIN 4	IN	RX	UART
PIN 5	OUT	TX	UART
PIN 6	IN	D-	USB
PIN 7	OUT	D+	USB
PIN 8	—	NC	
PIN 9	OUT	BEEPER	Connected to passive buzzer
PIN10	OUT	DLED	Indicator for decoding successfully
PIN11	—	NC	
PIN12	IN	TRIG	Low level triggers decoding

## 1.5 Readable Barcode Type

	Readable	Default Readable
Codabar	✓	✓
Code 11	✓	×
Code 39/Code 93	✓	✓
UPC/EAN	✓	✓
Code 128/EAN128	✓	✓
Interleaved 2 of 5	✓	×
Matrix 2 of 5	✓	×
MSI Code	✓	×
Industrial 2 of 5	✓	×
GS1 Databar	✓	✓
QR code	✓	✓
Data Matrix	✓	✓
PDF417	✓	✓

## 1.6 Reference Diagram

Ref. circuit diagrams:

Circuit diagram for triggering PIN 12:

Circuit diagram for pin 9(passive buzzer):

Circuit diagram for PIN 10(DLED):

## 1.7 Setup Code

Customer can set module by scan setup code.

**Default: setup code on**

**Off**

Output details in setup code

**Default: Not output**

**Output**

## 1.8 Save and Cancel

Scan cancel code to cancel wrong read date.

**Save**

**Cancel last byte**

**Cancel all read bytes**

**Cancel changes**

## 1.9 Reset

Back to Factory Setting by scan follow code.

**Reset**

## 2 Communication interface

GM65-S can receive database, control module and set functional parameter by TTL - 232.

### 2.1 Series Communication Interface

It's default and common to connect module and mainframe(such as PC, POS) by series communication interface. Make sure communication parameter for module and mainframe are same, then it will communicate smooth and correctly.

**Series Output**

TTL-232 is used for series interface which suitable for most system. Required change-over circuit for RS-232.

Default Parameter as formForm 2- 1. Only Baud Rate can be changed.

Form 2- 1 Default Parameters

Parameters	Default
Series communication interface	Standard TTL-232
Baud rate	9600
Verification	N
Data bit	8
Stop bit	1
CTSRTS	N

#### Baud Rate Settlement

**1200bps**

**4800bps**

**9600bps(Default)**

**14400bps**

**19200bps**

38400bps

57600bps

115200bps

### 2.1.1 Serial Port Check Bit Configuration

Modify the parity bit of the serial port by scanning the following configuration code.

\*NONE

ODD

EVEN

### 2.1.2 Serial Port and Full Code Open Shortcut Configuration

Serial Port and Full Code Open Shortcut

## 2.2 USB HID Interface

Scan the following code to become HID device when module connects PC by USB.

**\*USB HID device**

### 2.2.1 HID Type Device Selection

When the device is a HID type device, it can be 2 different types of devices.

**\*HIDKBW**

**HIDPOS**

### 2.2.2 HID Parameter Configuration

Scan the following code to modify the PC access cycle for HID devices.

**\*1ms**

**3ms**

**5ms**

**10ms**

Modify the interval between the device from a valid message to a released message by scanning the following setup code.

**\*0ms**

**1ms**

**5ms**

**10ms**

**15ms**

Modify the interval between the device from releasing message to the next valid message by scanning the following setup code.

**\*0ms**

**1ms**

**5ms**

**10ms**

**15ms**

Modify the state of the CapsLock when it prints by scanning the following setup code.

**\*Off**

**On**

### 2.2.3 HID Lead Key Output

By scanning the following setup code to make HID output a leading message before each segment of data, so as to facilitate customer software development and positioning. The key value is ctrl+shift+r.

\*HID leading Forbid

Allow

### 2.2.4 HID KBW Serial Output at the Same Time

By scanning the following setup code,while HID KBW is output, data is output through serial port.

\*Forbid

Allow

### 2.2.5 HIDPOS HIDKBW Output at the Same Time

By scanning the following setup code to enable HIDKBW data output while HIDPOS output.

\*Forbid

Allow

## 2.3 USB Virtual Serial Port

Scan the following code to become virtual serial port output pattern when module connects PC by USB.

USB Virtual serial port

## 3 Read Mode

### 3.1 Continuous Mode

On this mode, reading module read code continuous and automatic.

Break after reading one code, break time is changeable.

Click the toggle key to pause. Then click to continuous cyclic read code.

**Default Continuous Mode**

#### Time settlement for single read

The longest time before first successful reading. After this time, module will be into no read time.

Single Read time: 0.1~25.5 s, step-size: 0.1s;

0 means infinite time interval.

Default time: 5s

**1000ms**

**5000ms**

**default 3000ms**

**infinite time interval**

#### Break time settlement

Time between two read. Can be settled from 1 to 25.5 s, step-size: 0.1s; default 1.0s

**No break**

**500ms**

**default 1000ms**

1500ms

2000ms

### Same barcode reading delay

The same barcode reading delay refers to that after the module reads the same bar code, it will be compared with the last reading time, when the interval is longer than the reading delay, the same barcode is allowed to be read, otherwise the output is not allowed.

Same barcode reading delay

\*Same bar code reading without delay

### Same barcode reading delay time

When the same barcode reading delay is enabled, scan the following code to set same barcode reading delay time.

Infinite delay

500ms

1000ms

3000ms

5000ms

## 3.2 Induction Mode

After setting, module begins to monitor brightness immediately. When scene changed, module will begin to read until time of image stabilization over.

After first successful reading or single reading time out, module will monitor brightness again after some time (changeable)

Module will cycle working as above when follow happen: module can't find code between single read time, then it will stop reading and jump to monitor brightness.

On induction mode, module can begin reading code by click, and it will begin to monitor brightness when release toggle key or successfully output information.

**Induction Mode**

### **Time settlement for single read**

The longest time read before first successful reading. After this time, module will be into no read time.

Single Read time: 0.1~25.5 s, step-size: 0.1s;

0 means infinite time interval.

Default time: 5s

**1000ms**

**Default 5000ms**

**3000ms**

**infinite time interval**

### **Break time settlement**

After one successful output or time out for single read. Module will be into monitor after some time.

Time from 0 to 25.5 s, step-size: 0.1s; default 1.0s

**No Break**

**500ms**

**Default 1000ms**

**1500ms**

**2000ms**

### Image stabilization time

Image stabilization time: the time cost after module find scene change then waiting for the scene stable. Time from 0s to 25.5s, step size 0.1s. Default 0.4s.

\*0ms

100ms

400ms

1000ms

2000ms

### Sensitivity

Detect the degree of change in the scene in inductive reading mode. When the reading module judges that the scene change degree meets the requirements, it will switch from the monitoring state to the reading state.

\*Ordinary sensitivity

Low sensitivity

High sensitivity

Extra high sensitivity

### Same barcode reading delay

The setup code is the same as in **Continuous Mode**.

## 3.3 Manual Mode

Manual mode is default mode. Click toggle key begin to read, stop when output or release toggle key

**Manual Mode**

Scan the following code to configuration edge trigger or level trigger.

**\*Level Trigger**

**Edge Trigger**

Into sleep mode after not work for a while, can be settled by following code.

**Sleep mode on**

**Sleep mode off**

Come into sleep mode, can wake up by key. Module will restart after dropping out sleep mode.

When deep sleep is not enabled, you can set the idle time for light sleep by scanning the following Settings.

**0ms**

**\*500ms**

**3000ms**

**5000ms**

### 3.4 Command Triggered Mode

Module begins to read when receive scan command from mainframe( bit0 of zone bit 0x0002 writes"1" ) , and stop at output or read timeout.

### Command triggered mode

Under command triggered mode, command for serial port trigger is 7E 00 08 01 00 02 01 AB CD;  
After receiving command, model will output “ 02 00 00 01 00 33 31” and start scan.

### Time settlement for single read

Read and Scan time before output. From 0.1s to 25.5s, step size 0.1s. 0 : infinite time interval;  
Default: 5s

1000ms

Default 5000ms

3000ms

infinite time interval

## 3.5 POS Mode

Users can quickly configure the module to work in POS mode by scanning the following code.  
Including the following main features:

- Read mode is command trigger mode
- The communication interface is serial port
- Turn off startup tone
- Turn off ending character

POS Mode

## 4 Read area

### 4.1 Full Width Area

When the read area is a full-width area, the module will scan the barcode around with the center as the priority, and the barcode can be located at any position of the screen.

**\*Full Width Area**

### 4.2 Central Area only

When the reading area is the central area, the central position of the barcode must be in the central area set. Bar codes are not within the scope of the region are not identified and output.

**Central Area only**

Set the size of the central area:

The central area is an area with the center of the whole image as the central point. The size of this area is set in proportion to the width or height of the whole image, and the value range is 1-100. If set to 20, it is located in an area 20% of the width \* 20% of the height of the center.

Modify the central area size

The common central area size can be set by scanning the following code:

**central area size-20%**

**central area size-40%**

**central area size-60%**

When the common central area size does not meet the needs, users can also scan the "modify the central area size" setting code to customize the configuration.

**modify the central area size**

Example: change the center area size to 50%

1. Check the character table to get the hexadecimal value of "50" characters: "32"
2. Confirm whether the setting code is on or not. If it is off, please scan the "open setting code" setting code (see section 1.4).
3. Scan the setting code of "modify the size of central area"
4. Scan data setting codes "3" and "2" successively (see appendix E)
5. Scan "save" setting code (see appendix F)

## 5 Lighting and Collimate

### 5.1 Lighting

Head lamp is used to additional lighting when read.

Normal(default): Head lamp will be on when read, others off.

Normally on: always on after boot.

OFF: head lamp is always off

**Normal**

**Normally on**

**Off**

### 5.2 Collimation

There will be a pointing light beam which can help user to find best distance.

Normal(default): pointing light beam shows when read

Normally on: pointing light beam shows after power on until power off

No Collimation: no pointing light beam

**Normal(default)**

**Normally on**

**No Collimation**

## 6 Prompts

### 6.1 Prompts Tone

Read "buzzer drive frequency", the buzzer can be set to active/passive buzzer, the drive frequency of the passive buzzer can also be set.

**Buzzer drive frequency-passive low frequency**

**\*Buzzer drive frequency-passive medium frequency**

**Buzzer drive frequency-passive high frequency**

**Buzzer drive frequency - active drive**

In the active buzzer mode, scan "Buzzer working level - high" can be set to low level when free, high level when busy; scan "Buzzer working level - low" can be set to high level when free, low level when busy.

**\*Buzzer working level - high**

**Buzzer working level - low**

Scan "Open Start-up tone" can open start-up tone. Scan "Close Start-up tone" can close start-up tone.

**\*Open Start-up tone**

**Close Start-up tone**

Silence: Close all prompt tones

Silence on

\*Silence off

## 6.2 Read code successfully tone

Default on

Close read code successfully tone

Duration time setting. Default: 60ms

30ms

\*60ms

90ms

120ms

## 6.3 Data code format

Read following to enable the reading module to read the Chinese barcode of various encoding format.

Input Data code format GBK

Input Data code format UTF8

\*Input Data code format AUTO

Read following to print Chinese data according to specified code format.

GBK format: notepad, UNICODE format: WORD and input box for chat tools

**\*Output Data code format GBK**

**Output Data code format UTF8**

## 6.4 Keyboard Settlement

Scan following code to change keyboard.

**Default Keyboard- US**

**Czech**

**France**

**Germany**

**Hungary**

**Italy**

**Japan**

**Spain**

**Turkey-F**

**Turkey-Q**

## 6.5 Virtual keyboard Allow

In order to be able to use in more areas, we also provide the virtual keyboard function, so that the virtual keyboard can be output in any keyboard mode, but it will relatively lose some output efficiency. In addition, when using a virtual keyboard, you must ensure that the numeric keys on the keypad are valid. Note that the virtual keyboard must be available at version 1.21 or above.

\*Standard keyboard

Virtual keyboard

In order to adapt to different application scenarios, the virtual keyboard has two different output modes for control characters smaller than 0x20, and the user can switch by scanning the following code.

Ctrl Mode

\*Alt Mode

## 6.6 Image Flip

When meet flipped or mirror image, like:

原始图像

镜像翻转

Scan code into or exit image flip mode

image flip mode

Exit

PS: in the image flip mode can only scan flipped image. For normal, should exit.

## 6.7 Black and White Flip

\* One-dimensional barcode forbidden anti-color decoding

Allow

\* Two-dimensional barcode forbidden anti-color decoding

Allow

## 7 Data Edition

Sometimes we need to edit the data before output to make data separation and processing more easily.

Data edition include:

- Add Prefix
- Add Suffix
- Cut data
- Output CodeID
- Output “RF” when fail to decode
- Add End words”Tail”

Output sequence after data edition:

【Prefix】 【CodeID】 【Data】 【Suffix】 【Tail】

### 7.1 Prefix

#### Add prefix

Prefix is on the head of encoding Information , and can be self-defined.

Scan the code to add prefix.

Allow to add prefix

Default no prefix

#### Change prefix

Scan “change prefix” and “setup code” code to change prefix.

Use 2 base 16 to express each character.

Max 15 characters.

ASCII on appendix D.

change prefix

### E.G. Change prefix to “DATA”

1. “DTAT” in base 16: “44”, “41”, “54”, “41”
2. Confirm open the “ setup code”, if not, find on 1.4
3. Scan “change prefix” code
4. Successively scan “Code ID”: “4”, “4”, “4”, “1”, “5”, “4”, “4”, “1”

## 7.2 Suffix

### Add Suffix

Suffix on the end of encoding Information, and can be self-defined.

Allow add suffix

Default no suffix

### Change suffix

Scan “ change suffix” and “setup code” code to change prefix.

Use base 16 to express each character.

Max 15 characters. ASCII on appendix D.

Change Suffix

### E.G.: Change suffix to “DATA”

1. “DTAT” in base 16: “44”, “41”, “54”, “41”
2. Confirm opening the “setup code”, if not, find on 1.4
3. Scan “change suffix” code
4. Successively scan “Code ID”: “4”, “4”, “4”, “1”, “5”, “4”, “4”, “1”
5. Scan “save” code

## 7.3 CODE ID

### Add CODE ID

Users can identify different types of bar code by CODE ID. CODE ID use one character to identify and can be self- defined.

**Allow add CODE ID**

**Default close CODE ID**

### **Default of CODE ID**

Scan “ Default of CODE ID” to back default ID, default ID on appendix C

**all bar code back to default ID**

### **Change CODE ID**

Users can change CODE ID of any bar code by scan the setup code (as follow) and data edition code.

Base 16 is used to express each CODE ID.

ASCII on appendix D.

#### **E.G.: change CODE ID of CODE 128 to “A”**

1. Find “A”=“41” in base 16
2. Confirm opening the “setup code”, if not, find on 1.4
3. Scan “ change CODE 128”
4. Successively scan “Code ID”: “4”, “1”
5. Scan “save” code

Change CODE ID LIST

**Change CODE ID of EAN13**

**Change CODE ID of EAN8**

**Change CODE ID of UPCA**

**Change CODE ID of UPCE0**

Change CODE ID of UPCE1

Change CODE ID of CODE 128

Change CODE ID of CODE 39

Change CODE ID of CODE 93

Change CODE ID of CODE BAR

Change CODE ID of Interleaved 2 of 5

Change CODE ID of Industrial 25

Change CODE ID of Matrix 2 of 5

Change CODE ID of CODE 11

Change CODE ID of MSI

Change CODE ID of RSS

Change CODE ID of limited RSS

Change CODE ID of expended RSS

Change CODE ID of QR CODE

Change CODE ID of Data Matrix

Change CODE ID of limited PDF417

## 7.4 Tail

Open this function to help system quickly distinguish current decoding results.

Scan “Add tail” to open this function, if read success, there will be tail on the end of decode data.

Close tail

\*Add tail “CR”

Add tail “TAB”

Add tail “CRLF”

## 7.5 Cut out Data

Open to output part of data.

[Data] is composed of [Start] + [Center] + [End]

Character length of “start” and “end” can be changed

\*Output whole data

Output Start part

Output End Part

Output Center part

**Change length of [Start]-M**

Scan “ Change M” code and “data edition” code to change length of [Start], max 255 characters

Base 16 is used to express length. ASCII on appendix D.

**Change M**

**Change length of [End]-N**

Scan “ Change N” code and “data edition” code to change length of [Start], max 255 characters

Base 16 is used to express length. ASCII on appendix D.

**Change N**

**Output Start part**

**E.G. Output “1234567890123” of whole decode information “ 1234567890123ABC”**

1. “13” =”0D” in base 16
2. Confirm opening the “setup code”, if not, find on 1.4
3. Scan” change length M”
4. Successively scan “Code ID”: “0”, “D”
5. Scan “save” code
6. Scan” Output Start part”

**Output End Part**

**E.G. Output “ABC” of whole decode information “ 1234567890123ABC”**

1. “3” = “03” in base 16
2. Confirm opening the “setup code” , if not, find on 1.4
3. Scan ”change length N”
4. Successively scan “Code ID”:”0”, “3”
5. Scan “save” code
6. Scan” Output Start part”

### Output Center part

**E.G.: Output “0123” of whole decode information “1234567890123ABC”**

1. “10”=“0A”; “3”=“03” in base16
2. Confirm opening the “setup code”, if not, find on 1.4
3. Scan “change length N”
4. Successively scan “Code ID”: “0”, “3”
5. Scan “save” code
6. Scan “change length M”
7. Successively scan “Code ID”: “0”, “A”
8. Scan “save” code
9. Scan “Output Center part”

## 7.6 RF Information

RF(Read Fail): Users can self-define output information when read fail.

**Output RF information**

**Default not output**

### Change RF information

Scan “change RF information” and “data edition code” to change RF information.

Base 16 is used to express, max at 15 character. ASCII on appendix D.

**Change RF information**

**E.G.: change RF to “FAIL”**

1. Find “FAIL” in base-16: “46”, “41”, “49”, “4C”
2. Confirm opening the “setup code”, if not, find on 1.4
3. Scan “change RF information”
4. Successively scan “4”、“6”、“4”、“1”、“4”、“9”、“4”、“C”
5. Scan “save” code

## 7.7 Output Protocol

The output format of the decoded result can be modified in serial/virtual serial mode by scanning the following Settings code.

The format output with protocol is as follows: <03>< length >< decoded data >.

In addition, when in serial/virtual serial mode the output mode of the band protocol is enabled, the module will not add an terminator to the decoded data.

**\*Pure data**

**With the agreement**

## 7.8 UPCA convert to EAN13

Scan the following code to set UPCA convert to EAN13.

**Allow**

**\*Forbid**

## 7.9 Commodity Code Check Output

Scan the following code to set commodity code check digit output (including EAN8 EAN13 / UPCE0 / UPCE1 / UPCA).

**\*Allow**

**Forbid**

## 8 Bar code type enables/disable configuration

### 8.1 All types of bar code can be decoded

After scan “ Forbid read all bar code” , module will only support to scan setup code.

Support all

Forbid read all bar code

\*Open default support types

### 8.2 Strengthen the Reading Ability

The bar code reading ability is enhanced through configuration, which will improve the reading Angle of all bar codes, improve the equipment's support for angles above 45° , and improve the contrast and gradient code support. Disabling Angle hardening will increase decoding speed.

\*Forbid to enhanced

Enhanced

### 8.3 EAN13

Allow reading EAN13

Forbid reading EAN13

**\* 2 bits extra-code Forbidden**

**2 bits extra-code Allow**

**\*5 bits extra-code Forbidden**

**5 bits extra-code Allow**

## 8.4 EAN8

**\*Allow reading EAN8**

**Forbid reading EAN8**

**\*Interleaved 2 of 5 max length at 32**

**Interleaved 2 of 5 max length at 255**

## 8.14 Industrial 25

**Allow reading Industrial 25**

**\*Forbid reading Industrial 25**

Scan following code to set min length of Interleaved 25

**Industrial 25 min length at 0**

**\*Industrial 25 min length at 4**

Scan following code to set max length of Interleaved 25

**\*Industrial 25 max length at 32**

**Industrial 25 max length at 255**

## 8.15 Matrix 2 of 5

**Allow reading Matrix 2 of 5**

**\*Forbid reading Matrix 2 of 5**

Scan following code to set min length of Matrix 2 of 5

**Matrix 2 of 5 min length at 0**

**\*Matrix 2 of 5 min length at 4**

Scan following code to set max length of Matrix 2 of 5

**\*Matrix 2 of 5 max length at 32**

**Matrix 2 of 5 max length at 255**

Scan following code to set the validation format of Matrix 2 of 5

**Matrix 2 of 5 validation format Mod10**

**\*Matrix 2 of 5 validation format None**

## 8.16 Code11

**Allow reading Code11**

**\*Forbid reading Code11**

Scan following code to set min length of Code11

**Code11 min length at 0**

**\*Code11 min length at 4**

Scan following code to set max length of Code11

**\*Code11 max length at 32**

**Code11 max length at 255**

Scan following code to set the validation format of Code11

**Code11 use 1bit check**

**\*Code11 use 2bit check**

## 8.17 MSI

**Allow reading MSI**

**\*Forbid reading MSI**

Scan following code to set min length of MSI

**MSI min length at 0**

**\*MSI min length at 4**

Scan following code to set max length of MSI

**\*MSI max length at 32**

**MSI max length at 255**

## 8.18 RS

Allow reading RSS-14

\*Forbid reading RSS-14

Allow reading limited RSS

\*Forbid reading limited RSS

Allow reading expended RSS

\*Forbid reading expended RSS

Scan following code to set min length of RSS

RSS min length at 0

\*RSS min length at 4

Scan following code to set max length of RSS

\*RSS max length at 32

RSS max length at 255

## 8.19 DM

\*Allow reading DM

Forbid reading DM

Scan following code to set whether the module supports decoding multiple DM barcodes simultaneously

**\*Forbid Read multiple DM barcodes simultaneously**

**Allow Read multiple DM barcodes  
Simultaneously**

## **8.20 PDF417**

**\*Allow reading PDF417**

**Forbid reading PDF417**

## 9 Serial Port Instruction

Users can settle the module by sending instruction from mainframe.

Please make sure communicate parameter complete matching between module and mainframe.

Module default serial communicate parameter: **Baud rate 9600bps; No check; 8 bit data; 1 bit stop bit; No flow control.**

### 9.1 CRC Algorithm

CRC: CRC\_CCITT check value (2 bytes).

Suitable for Types、Lens、Address、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

Reference code of C:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc & 0x10000) != 0)
                crc ^= 0x11021;
            if((*ptr & i) != 0)
                crc ^= 0x1021;
        }
        ptr++;
    }
    return crc;
}
```

PS: when no need for checking CRC, CRC bite can be filled in 0xAB 0xCD

## 9.2 Read Zone Bit

Max 256 bytes/time for zone bit reading.

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x07 (1 byte)

Lens: 0x01 (1 byte)

Address : 0x0000~0x00FF (2 bytes) , address to start reading zone bit

Datas: 0x00~0xFF (1 byte) , Numbers of zone bit for Sequential read, 0x00= 256bytes

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Address、Ddatas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1 , so divide 0x11021
                crc ^= 0x11021;
            if((*ptr&i) != 0) //If the standard is 1 , so CRC = last CRC + standard CRC_CCITT
                crc ^= 0x1021;
        }
        ptr++;
    }
    return crc;
}
```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

**Output: {Head2} {Types} {Lens} {Ddatas} {CRC}**

1) Read successfully and return data

PS: Head2: 0x02 0x00

Types: 0x00 (read succeed)

Lens: numbers of upload bytes

Datas: 0x00~0xFF means read data.

CRC: CRC\_CCITT check value. Suitable for Types、Lens、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

(The reference code is the same as above)

2) CRC failed

No response command

3) Unknown command response

No response command

**E.G.:**

Read address 0x000A of Zone bit

1) Read successfully and return data is 0x3E.

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01 0xEE 0x8A

Output: 0x02 0x00 0x00 0x01 0x3E 0xE4 0xAC

2) CRC wrong

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01 0x11 0x22

Output : None

3) When length of command too short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01

Output: None

## 9.3 Write Zone Bit

Max 256 bytes/time for zone bit reading.

**The modified content of the zone bit will be lost after power failure. If the modified content is needed after power loss, You need to save the zone bit to internal Flash(9.4).**

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x08 (1 byte)

Lens: 0x00~0xFF (1 byte) , means numbers of bytes of this datas, times of continuous writing.

Address: 0x0000~0xFFFF (2 bytes) , start location of write

Datas: 0x00~0xFF (1~255 bytes) , datas wrote in zone bit. When configuring multiple zone bit,must follow the order of address from low to high to fill the data domains.

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Address、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1, so divide 0x11021
            {
                crc ^= 0x11021;
            }
            if((*ptr&i) != 0) //If the standard is 1, so CRC = last CRC + standard CRC_CCITT
            {
                crc ^= 0x1021;
            }
        }
        ptr++;
    }
    return crc;
}
```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Read successfully

PS: Head2: 0x02 0x00

Types: 0x00 (read succeed)

Lens: 0x01

Datas: 0x00

CRC: CRC\_CCITT check value (0x33 0x31)

2) CRC failed

No response command

3) Unknown command response

No response command

**E.G.:**

Write 0x3E in 0x000A of zone bit

1) Successfully set

Input : 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E 0x4C 0xCF

Output: 0x02 0x00 0x00 0x01 0x00 0x33 0x31

2) CRC wrong

Input: 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E 0x11 0x22

Output: None

3) When length of command too short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E

Output: None

## 9.4 Save Zone Bit To Internal Flash Instruction

To save the device of the zone bit list to internal Flash, you need to send a save command.

**Note:** the device cannot save a single zone bit configuration separately, and must keep the entire list at the same time.

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00

Types: 0x09

Lens: 0x01

Address: 0x0000

Datas: 0x00

CRC: CRC\_CCITT check value (0xDE 0xC8)

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Saved successful

PS: Head2: 0x02 0x00

Types: 0x00 (read succeed)

Lens: 0x01

Datas: 0x00

CRC: CRC\_CCITT check value (0x33 0x31)

2) CRC failed

No response command

3) Unknown command response

No response command

## 9.5 Zone Bit Reset To Defaults

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00

Types: 0x09

Lens: 0x01

Address: 0x0000

Datas: 0xFF

CRC: CRC\_CCITT check value

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Saved successful

PS: Head2: 0x02 0x00

Types: 0x00 (read succeed)

Lens: 0x01

Datas: 0x00

CRC: CRC\_CCITT check value (0x33 0x31)

2) CRC failed

No response command

3) Unknown command response

No response command

## 9.6 Program Erasure Operation

Command Format:

**Input: {Head1} {Types} {Lens} { NotUse } {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x05 (1 byte)

Lens: 0x01 (1 byte) Numbers of Datas for Sequential read

NotUse: 0x0000 (2 bytes) , 2 bytes 0x00

Datas: 0x11/0x22/0x33 ( 1 bytes ) , represents the data to be written;0x11:Erase the bootstrap;  
0x22:erase the user program;0x33:Erase the bootstrap and user program.

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、NotUse、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1 , so divide 0x11021
                crc ^= 0x11021;
            if((*ptr&i) != 0) //If the standard is 1 , so CRC = last CRC + standard CRC_CCITT
                crc ^= 0x11021;
        }
        ptr++;
    }
    return crc;
}
```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

### Output: {Head2} {Types} {Lens} {Datas} {CRC}

1) Erased successful

PS: Head2: 0x02 0x00

Types: 0x00 (read succeed)

Lens: 0x01

Datas: 0x00

CRC: CRC\_CCITT check value (0x33 0x31)

2) CRC failed

No response command

3) Unknown command response

No response command

## E.G.:

After erasure the user program, the device will automatically enter the boot program and wait for the download of the new user program

### 4) Erased successful

Input : 0x7E 0x00 0x05 0x01 0x00 0x00 0x22 xx xx

Output: 0x02 0x00 0x00 0x01 0x00 0x33 0x31

### 5) CRC wrong

Input: 0x7E 0x00 0x05 0x01 0x00 0x00 0x22 xx xx

Output: None

6) When length of command to short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x05 0x01 0x00 0x00 0x22

Output: None

## 9.7 List of zone bit

Zone Bit	0x0000
Data Bit	Function
Bit 7	1: Open LED when successfully read    0: Close
Bit 6	1: Mute off                      0: Mute on
Bit 5-4	00: No light                      01: Standard                      10/11: Always on
Bit 3-2	00: No light                      01: Standard                      10/11: Always on
Bit 1-0	00: Manual Mode    01: Command Triggered Mode    10: Continuous mode 11: Induction Mode
Zone Bit	0x0002
Data Bit	Function
Bit 7-1	Keep
Bit 0	Command mode triggers flags, Automatically reset after scanning 1: trigger                      0: no trigger
Zone Bit	0x0003
Data Bit	Function
Bit 7-2	HID query cycle.    Cycle = (Reg0x0003[7:2]+1) ms
Bit 1	1: Close Settlement Code                      0: Open
Bit0	1: Output content of settlement code    0: Not output
Zone Bit	0x0004
Data Bit	Function
Bit 7-0	The time of Image stabilization 0x00-0xFF: 0.0-25.5s

Zone Bit	0x0005
Data Bit	Function
Bit 7-0	Read interval 0x00: No interval      0x01-0xFF: 0.0-25.5s
Zone Bit	0x0006
Data Bit	Function
Bit 7-0	Time for single read 0x01-0xFF: 0.0-25.5s
Zone Bit	0x0007
Data Bit	Function
Bit 7	Automatic deep sleep 1: On      0: Off
Bit6-0	Free Time (High Bit14-8) Unit: 100ms
Zone Bit	0x0008
Data Bit	Function
Bit7-0	Free Time (Low Bit14-8) Unit: 100ms
Zone Bit	0x0009
Data Bit	Function
Bit7-2	HID the interval before release      Interval = (Reg0x0009[7:2]) ms
Bit 1-0	Image rollovers 00: Forbid    01: Allow    10/11: Keep
Zone Bit	0x000B
Data Bit	Function
Bit 7-0	Time duration for successfully read sound 0x00-0xFF; 0-255ms
Zone Bit	0x000C
Data Bit	Function
Bit 7-2	HID the interval after release      Interval = (Reg0x000C[7:2]) ms
Bit1	CapsLock Switch    0: On    1: Off
Bit0	Piezo Buzzer 0: high level when free, low level when busy 1: low level when free, high level when busy
Zone Bit	0x000D
Data Bit	Function
Bit 6	Virtual keyboard enable flags      0: Forbid      1: Allow
Bit5-4	Input data encoding format 00: GBK      01: Keep      10: AUTO      11: UTF8
Bit 3-2	Output data encoding format 00: GBK    01: UNICODE    10: Keep    11: UTF8
Bit1-0	00: serial port output 01: USB PC Keyboard 10: Keep 11: USB virtual serial port

Zone Bit	0x000E
Data Bit	Function
Bit 7-4	Light sleep free time    Free time= (Reg0x000E[7:4]*500) ms
Bit3	Keep
Bit2	1: Decode successfully sound on    0: Decode successfully sound off
Bit1	1: Turn off start-up tone    0: Turn on start-up tone
Bit0	1: Allow serial port mode HID protocol    0: Forbid
Zone Bit	0x000F
Data Bit	Function
Bit7-0	Sensitivity adjustment parameter 1 0x00-0xFF: higher value, lower sensitivity, default value 0x32
Zone Bit	0x0010
Data Bit	Function
Bit7-0	Sensitivity adjustment parameter 2 0x00-0xFF: higher value, lower sensitivity, default value 0x0A
Zone Bit	0x0011
Data Bit	Function
Bit 7-0	Exposure Settings - high bytes 0x00-0xFF
Zone Bit	0x0012
Data Bit	Function
Bit 7-0	Exposure Settings - low bytes 0x00-0xFF
Zone Bit	0x0013
Data Bit	Function
Bit 7	Same barcode reading delay setting 0: Turn off    1: Turn on
Bit 6-0	Same barcode reading delay time (Unit: 100ms) 0x00: Infinite length    0x01-0x7F: 0.1-12.7s;
Zone Bit	0x0014
Data Bit	Function
Bit 7-0	Reserved time for information output (Unit: 10ms) 0x00-0xFF: 0-2.55 s
Zone Bit	0x002B, 0x002A
Data Bit	Function
Bit 15	Keep
Bit 14-13	Parity Mode: 0: None    1: Odd    2: Even

## 10 Appendix A: Common serial port instruction

Parameter		Default Setting	Note
Communication interface			
TTL-232	Baud rate	9600	
	Verification	No	
	Bata Bit	8 bit	
	Stop Bit	1 bit	
	CTSRTS	No	

## 11 Appendix B: Common serial port instruction

Function	Instruction
Baud rate to 9600	7E 00 08 02 00 2A 39 01 A7 EA
Save settlements to Internal Flash	7E 00 09 01 00 00 00 DE C8
Find baud rate	7E 00 07 01 00 2A 02 D8 0F

Module will return following info after mainframe send serial port instruction - find baud rate

Return information	Baud rate
02 00 00 02 C4 09 SS SS	1200
02 00 00 02 71 02 SS SS	4800
02 00 00 02 39 01 SS SS	9600
02 00 00 02 D0 00 SS SS	14400
02 00 00 02 9C 00 SS SS	19200
02 00 00 02 4E 00 SS SS	38400
02 00 00 02 34 00 SS SS	57600

PS: SS SS= check value

## 15 Appendix F: Save or Cancel

After reading the data code, you need to scan the "save" setting code to save the data which you read. If there is an error when reading the data code, you can cancel the error reading.

For example, read a set code, and read data "A", "B", "C" and "D" in turn.

If you read "cancel the last read bit", the last read digit "D" will be cancelled.

If you read "cancel the previous read a string of data" will cancel the read data "ABCD",

If you read "cancel modification Settings", you will cancel the data "ABCD" and exit the modification Settings.

Save

Cancel the last read bit

Cancel the previous read a string of data

Cancel modification settings
